

react-modern-site: App Summary

One-page summary based only on repo evidence from the React + Vite codebase and deployment files.

What It Is

A single-page marketing site for RainbowMD, presented as an Electron Markdown editor with colorful themes, real-time preview, and HTML/PDF export. The repo ships the site as a React 18 SPA built with Vite and deployed to GitHub Pages.

Who It's For

Primary persona: creators, individual developers, and Markdown beginners who want a lightweight writing tool and a simple path to preview, export, and download plans.

What It Does

- Presents RainbowMD as a lightweight Electron Markdown editor.
- Highlights real-time preview as a core writing workflow.
- Promotes colorful themes as part of the product identity.
- Explains HTML/PDF export for sharing or document distribution.
- Shows three download options: free, beta, and product editions via Booth.
- Links users to the official page, GitHub repo, Ko-fi support, and a privacy policy page.

How It Works

- Entry/rendering: ``index.html`` hosts ``#root``; ``src/main.jsx`` mounts React 18 in ``StrictMode``.
- Routing: ``HashRouter`` and ``Routes`` in ``src/App.jsx`` serve five client routes: Home, Features, Plans, Links, and Support.
- UI composition: ``AppShell`` provides shared header/footer chrome; each route renders mostly static marketing content from arrays defined in ``src/App.jsx``.
- External/services flow: CTA links send users to Booth product pages, the GitHub repo, Ko-fi, the official site, and ``privacy-policy.html``.
- Build/deploy: Vite builds with base path ``/react-modern-site/``; GitHub Actions runs ``npm ci``, ``npm run build``, and deploys ``dist/`` to GitHub Pages.
- Backend/API/auth/persistence: Not found in repo.

How To Run

- Prerequisites: Node.js version not found in repo; npm is required.
- Install dependencies: ``npm install``
- Start local dev server: ``npm run dev``
- Optional production build: ``npm run build``
